Product Platform for Agricultural Solutions

ClimMob digital service for on-farm experimentation

Description

ClimMob is a digital service that facilitates on-farm experimentation using the tricot format. ClimMob supports trial setup from beginning to end (randomization, data collection using various digital channels, progress monitoring, automatic data analysis), ensuring a streamlined digitally supported process (using QR codes to ensure traceability), full flexibility to set up questionnaires. The solution, for researchers and development practitioners, is ready for deployment at scale (and is being scaled for variety testing with substantial BMGF support), but could be further optimized for agronomic applications (agronomic ontology, experimental protocols, etc.)
