

Cassava Business Connector (CBC)

Détenteur(s) de la Solution is **Adebayo Abass** et peut être contacté via **a.abass@cgiar.org**

Résumé

The cassava value chain is characterized by a communication gap between the value chain actors, leading to weak market linkage. Producers often do not know about the buyers, and the buyers do not know about the producers. Weak market linkage often creates an artificial gap in demand-supply and sometimes a glut effect. Resolving this problem requires efficient integration of value chain actors to improve communication and coordination, and create visibility to the value chain actors, including producers, input suppliers, processors, and end-users. Conventional procedures used for value chain promotion are an expensive and time-consuming process, and they often result in creating market linkage for a specific product. The Cassava Business Connector (CBC) is a digital innovation for cassava value chain integration to enhance market access. The App creates virtual value chain networks that enable a seamless integration of value chain actors and improve market linkages, with an ultimate aim to enhance income-generating opportunities to all the value chain actors.

Description Technique

CBC is an ICT App (<http://taat-cbc.org>) which can be used to map and register various stakeholders, including producers, aggregators, processors, service providers, NGOs, research institutions and others to create a virtual platform in each country. This system will help real-time status tracking, communication, coordination of information and management decisions. It allows for the creation of a database or repository of activities and records. It enables digital data collection, submission, and access using a smartphone or any internet-enabled devices. It includes a powerful map-based navigation tool for easy access to other actors (producers, buyers, sellers, and other stakeholders) for products or information. It includes an alert system and advertisement features for sharing product information and establishing direct trade linkages with the next users available on the platform.

Utilisation

CBC helps the coordination of material flow from fields to end-users, allows decentralized monitoring of production, real-time information exchange between the users, and offers secure accounts to each user, protected by login and password, for information safety.

Composition

The WebApp involves the building of a database of value chain actors, the products, services, geolocation, quantity, quality, certification, price, date of availability and other market information. Typically, users contribute market information and access the online database through computers or smartphones from any location and interact at any time with other value chain actors registered on the platform.

Moyens d'Application

Information on products and services Computers Smart phones

Agroécologies	Tous les Agroécologies.
Régions	Tous les Régions.
Developed in Countries	Tous les Pays.
Available in	le Cameroun, la République Démocratique du Congo, le Nigeria, la Sierra Leone, le Tanzanie, le Togo.
Forme(s) de la Solution	Application Numérique.
Application(s) de la Solution	Innovation du Marché.
Denrées Agricoles	le Manioc.
Bénéficiaires Cibles	Tous Agriculteurs, les Femmes, la Jeunesse, les Industries Agroalimentaires, les Agro-Commerçants, Autres Prestataires.

Commercialisation

Catégorie de Commercialisation

Technologie de gestion avec un potentiel commercial limité

Exigences de Démarrage

ICT App for market linkage and collaboration to verify information.

Coût de Production

The App was developed as a public good.

Segmentation de la Clientèle

All cassava value chain actors.

Rentabilité Potentielle

The App, being a public good, was not evaluated on the basis of revenue and profitability.

Exigences de Licence

No licensing requirement for the use of CBC.

Solution en tant que Bien Public

The solution, developed by IITA, is considered to be an international public good.

Institutions

Accompanying Solutions

Geographical Positioning System (GPS) to provide geolocation of products and services.
